PART 1: The Group Discount feature on items.

Background: As you know we now have a discount table that gives individuals or groups discounts on items that are part of the discount table. Currently the system has the ability to issue discounts to individuals if that individual has their email in the discount table.

New Requirement:
We now need to take it to another level. That is we need to continue to allow individuals emails access to the discount table and group access to the discount table.

The logic is basically the same but the big difference is that a group can have multiple emails that are associated with the group.

OK: So during the shopping cart process, the system must see if that individual buyer is link to a group. If the buyer's account is link to a group, than the email has access to that group's discounts item.

In the rare case where a buyer has a group and individual discount the group discount will override individual discount.

See next page…

Basically in order for a discount item to appear it will come from the fact that the customer is part of a group that has that product as a discount or the customer has his own discount table.

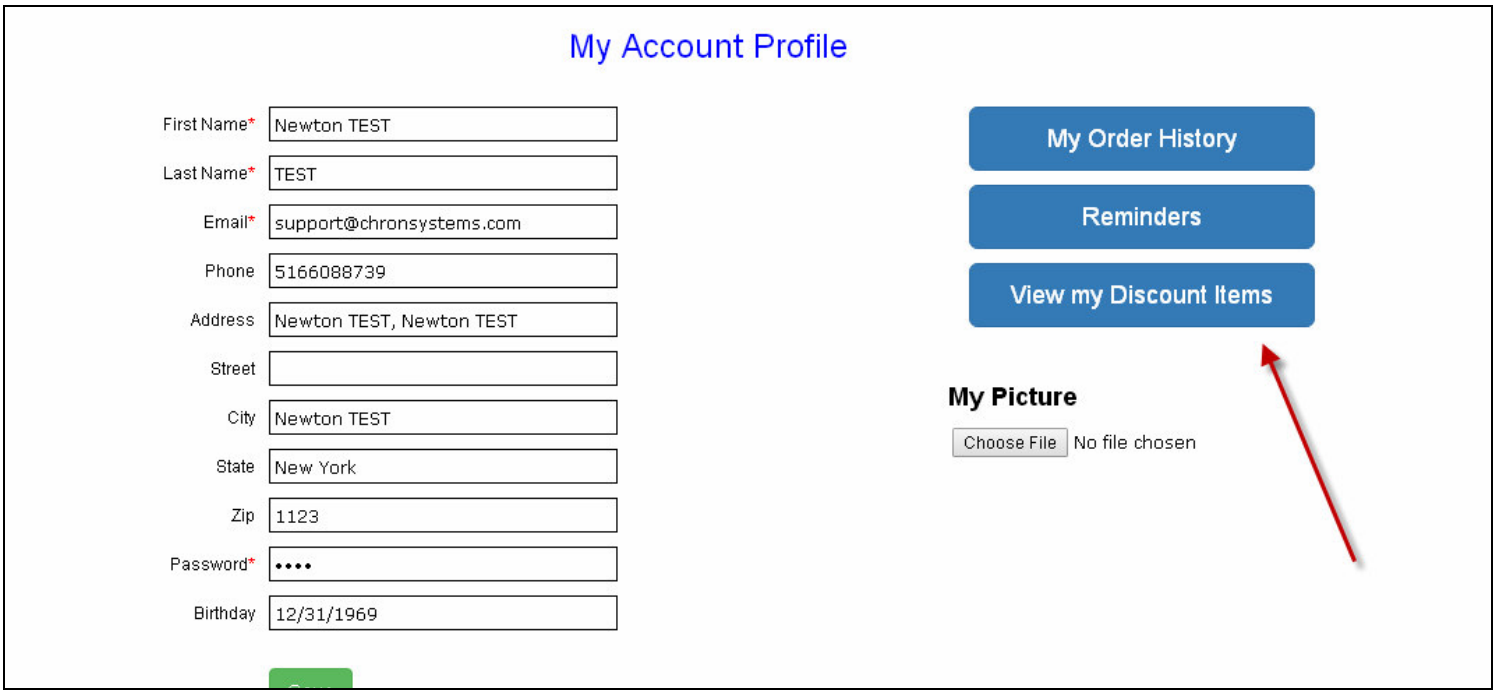
PART 2: If a customer is assigned to a group then they should only be able to view the group discount catalog from within their profile.



If the customer is assigned to a group display the name of the button as "View Group Discount Items"

That is all.
